

Question 1 [10 Points]

Imagine, you are developing a temperature monitoring system for a greenhouse. Write a Java program that takes N temperature readings from different sensors placed inside the greenhouse. Each temperature reading is a decimal value representing degrees Celsius. The program should display a summary containing the highest and lowest temperatures recorded and the average temperature across all readings.

Sample Input:	Sample Output:
Enter N: 5 Enter temperature 1: 23.5 Enter temperature 2: 24.8 Enter temperature 3: 22.1 Enter temperature 4: 25.3 Enter temperature 5: 23.9	Temperature range: 22.1 C - 25.3 C Average temperature: 23.52 C

Question 2 [5 Points]

1	public class trace{
2	public static void main(String[] args) {
3	int i = 3, sum = 0, t = 0, k = 4, j = 1;
4	boolean flag = true;
5	while(j<5) {
6	i++;
7	if(flag == true) {
8	sum += t % i + 2 - 3 * k;
9	System.out.println(sum--);
10	}
11	else{
12	sum += t % i + 3 - 5 * k;
13	System.out.println(sum++);
14	}
15	flag = !flag;
16	j++;
17	}
18	System.out.println(flag);
19	}
20	}

Output
