

Question 1 [10 Points]

Suppose, you work for a cafe called "One Word Snacks," where only snacks with **one-word** names are sold. You will be given an order list as a String, where one or more snack names are separated by commas. However, the operator sometimes makes mistakes while typing the orders due to having a faulty keyboard. Your task is to write a Java program that takes the order string as input and corrects the following mistakes:

- The first letter of each word is not capitalized.
- Random letters (other than the first letter of each word) are in uppercase.
- Words are divided by any symbol other than commas. If you find any symbol other than a comma, it should be converted to a comma.

[Note: You are only allowed to use the built-in length(), charAt() and codePointAt() method to solve this problem.]

Sample Input	Sample Output
Enter your order: pizza,c00kIe,PASTA-shawarma	Pizza, Cookie, Pasta, Shawarma
Enter your order: muFFIn+Tac03doNuT-Fries,piE	Muffin, Taco, Donut, Fries, Pie

Tentative Solution:

```
import java.util.Scanner;
public class Main {
    public static void main(String[] args) {
        Scanner sc = new Scanner(System.in);
        System.out.print("Enter your order: ");
        String s1 = sc.nextLine();
        String ans = "";
        boolean upper = true;
        for (int i = 0; i < s1.length(); i++) {
            char ch = s1.charAt(i);
            if (ch >= 'A' && ch <= 'Z' || ch >= 'a' && ch <= 'z') {
                if (upper) {
                    if (ch >= 'a' && ch <= 'z') {
                        ans += (char) (ch - 32);
                    } else {
                        ans += ch;
                    }
                }
                upper = false;
            }
            else {
                if (ch >= 'A' && ch <= 'Z') {
                    ans += (char) (ch + 32);
                } else {
                    ans += ch;
                }
            }
        }
    }
}
```

```
        }  
    }  
    else {  
        ans += ',';  
        upper = true;  
    }  
}  
System.out.println(ans);  
}  
}
```
