Question 1 [C03] [10 Points]

A farmer is having difficulty organizing fruits into baskets, each with a fixed capacity. Write a Java program that should take the **number of fruit types** as input, store **their quantities** in an integer array and display the initial basket capacities. Your task is to **assign these fruits to the baskets** by following the fruit allocation rules.

Fruit Allocation Rules:

- A basket can only hold fruits if its capacity is **equal to or greater than** the number of fruits to be placed. Otherwise, the basket is skipped.
- After placing fruits into a basket, the basket's capacity is **reduced** by the number of fruits allocated.

Finally, the program should display **updated capacities** of the basket and the **fruit types that could not be placed** in any basket, along with their corresponding quantities.

Given basket capacities : `basket_capacity[] = {5, 6, 7, 2, 3}`

Sample Input	Sample Output
Enter the number of fruit types: 3 Enter the quantity of each fruit type: For Fruit type 1 : 6 For Fruit type 2 : 9 For Fruit type 3 : 2	Initial basket capacities: 5 6 7 2 3 Fruit type 2 with quantity 9 could not be placed Updated basket capacities: 3 0 7 2 3
Explanation : • Fruit type 1 (6 fruits) is placed in the second basket (capacity 6). After allocation, the basket capacity is reduced to 0. • Fruit type 2 (9 fruits) cannot be placed in any basket because no basket has enough capacity, so it remains unplaced. • Fruit type 3 (2 fruits) is placed in the first basket (capacity 5). After allocation, the basket capacity is reduced to 3.
